

Skill Reference

22 skills · 16 agents
engine 0.4.0

Serge loads these itself when the work matches – `/skills` lists them live.

HOW SKILLS WORK

Serge reads a one-line index of all 22 at session start and loads a skill's body only when the task matches – so the cost is paid by the work that needs it, not by every turn. You rarely invoke one by hand; naming it in the ask is enough.

`/skills` What is published, live

`/tabarnak` The one skill with its own command – it takes over the session

DETERMINISTIC they compute, not opine

complexity Prices real Big-0 per function with the evidence chain, and catches `>` vs `>=` boundary slips

logic Truth tables, satisfiability, equivalence – proves a condition instead of reading it

system-integrity Detects unauthorised change to core files

safety-and-policy Where Serge declines, and how

HOW TO WORK process, not domain

problem-solving Goal → solution: restate, find the binding constraint, reduce to a solved problem, work one example by hand

debugging Symptom → cause: root cause before any fix, one hypothesis at a time, stop at three

feature-flow Build-and-troubleshoot discipline per feature

graph-engineering Multi-agent work as an explicit graph

BUILDING THINGS

backend HTTP/JSON APIs, real streaming, the boring parts done right

frontend-design Design direction – distinctive and intentional, not templated

theme-factory Ten ready palettes and font pairings, hex codes included

gamedev Shippable games – Godot first, gameplay loop to frame budget

steam Steamworks, store pages, and market research

resilient-external-calls Every network and subprocess call time-bounded and correct when it fails

DATA & DOCUMENTS

datasci Acquire, wrangle, analyse with statistical care, then present it

office Excel, Word, PowerPoint, PDF – create, read, edit, convert

finance Company evaluation, stocks, crypto due diligence

weather Open-Meteo – current, forecast, historical

music Ableton Live workflow and project files

THE COUNCIL 16 agents · `/agents`

architect Deep reasoning, strongest seat – scarce

scout Cheap codebase discovery – plentiful

reviewer Independent second opinion, separate seat

researcher Live-web research

+ 12 security, test, backend, frontend, data, devops, gamedev, debugger...

seats Each runs the seat its definition names – a scout never spends the architect's quota

AUTONOMOUS runs without you

`/tabarnak` **Story-by-story build loop.** A PRD becomes a queue; each story gets a FRESH session, and a box is checked only when its test command exits 0 – never by opinion. **progress.txt** carries learnings across iterations, because nothing else survives.

needs A PRD with a runnable test per story. No test, no box.

WORTH KNOWING

loading Naming a skill in your ask is enough – you do not have to invoke it

gates **complexity** and **logic** also run automatically as gates on code Serge writes, including code it borrowed

adding Drop a folder with a **SKILL.md** into `~/.serge/skills/` – see **skill-authoring**

itself **fable5-operating-style** is how a turn is run; **skill-authoring** is how to add one
